

# PICAXE BASICS

## ReadADC (Read analogue digital convertor) Sensor Debug

### Syntax:

**ReadADC pin,variable**

Pin is the ADC pin number on the picaxe

Variable receives the data byte read.

**Debug** sends all current variable values to the Debug screen F6

```
Code    Main:
        Readadc 1,b1
        Debug
        pause 500
        goto main
```

### Explained

**Readadc 1,b1** measures the voltage at **pin1**

A LDR (Light Dependent Resistor) sensor,

Gives it a number between 0 - 255

And stores it in variable **b1**.

**Debug b1** opens debug screen and shows the current value of the **variable b1**.

### Tinker

1 With the Debug screen open, F6 shortcut.

Move your hand over LDR sensor to change the value of variable **b1**.

2 Does the voltage reading go UP or Down with more light falling on the LDR?

### Note:

1 If the **Debug** screen does not automatically open you can open it from menu: PICAXE > Debug...

2 The **ReadADC** command is used for many sensors including LDR, Thermistors (temperature resistors), and measuring Moisture (the increased resistance between two electrodes in a Drying environment).

### Circuit
